Feltnova Fullsan

Belt accessories selection guide

Control the product flow

Transverse flights support inclined conveying. Longitudinal profiles help guide the belt. Corrugated sidewalls help contain loose products.

Define the application

Share product size, load, belt width and speed, conveyor incline, pulley diameters, operating temperature and cleaning conditions.

Coordinate the components

Match profile geometry, flight spacing, sidewall height and drive pattern. Check clearance at transitions, pulleys and return supports.

Choose a joining method

Review thermal welding or suitable mechanical fasteners with Feltnova. Confirm material compatibility, installation access and cleaning needs.

Confirm before ordering

Final dimensions, materials and operating limits depend on the selected belt and application. This guide is an overview, not a technical datasheet.
