FELTNOVA

Conveyor & Processing Belts

Feltnova | Industrial Production Selection Guide

Start with the process: identify the conveyed product, belt speed, load, conveyor geometry and required transfer accuracy.

Define the environment: record operating temperature, moisture, oils, cleaning agents and any contact with chemicals. Suitability must be checked against the actual operating conditions.

Choose the surface: consider grip, release behavior, abrasion and product support. Include the smallest pulley diameter and the required belt joint in the assessment.

Plan installation and maintenance: allow for tracking adjustment, tensioning access, inspection and safe replacement.

Discuss your application with Feltnova: provide conveyor drawings, product samples where available, and details of duty cycles. Final material and construction selection requires technical review.
