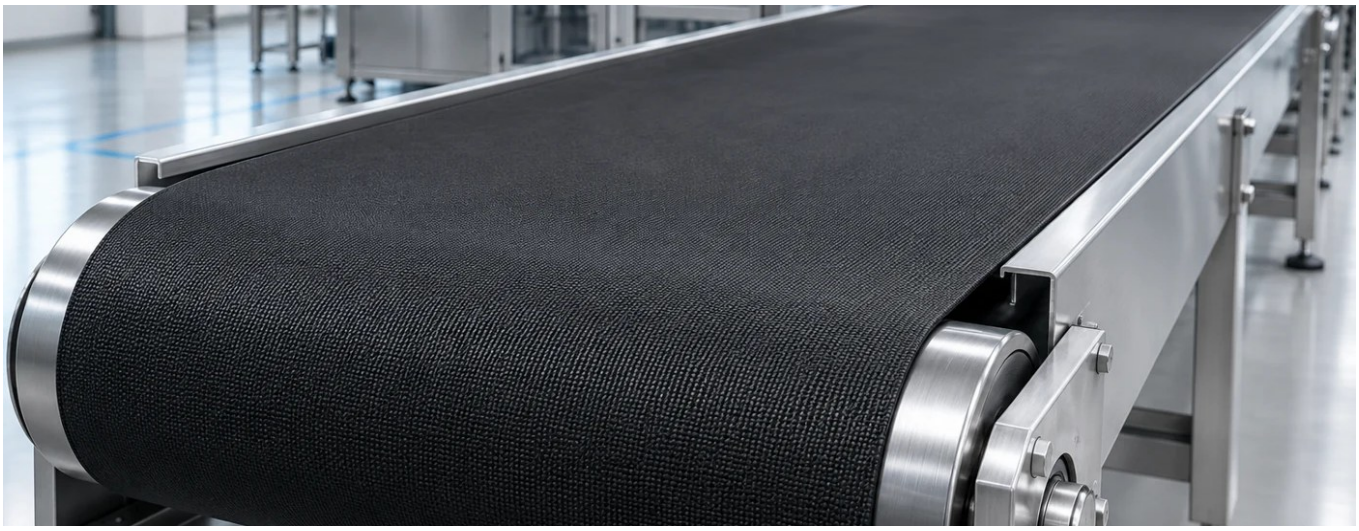
Belts for conveying, processing and power transmission

Feltnova Movement Systems brings together belt families for moving products, supporting production steps and transmitting power. Start with what the belt needs to do, then compare options for the line and operating environment.



Conveying and processing

Compare fabric-based conveyor belts, plastic modular belts and homogeneous belts. Consider how products are loaded, transferred and cleaned when selecting a belt surface and construction.

Drive and positioning

Flat belts support power transmission. Timing belts suit applications where repeatable positioning and synchronized movement are important.

What to specify

Record belt width and speed, product weight, pulley diameters and operating conditions. Include cleaning requirements and any contact with oils or moisture.
