Fabric Conveyor Belts

Conveying and processing

Controlled handling

Fabric-based conveyor belts can support continuous transport between metalworking operations. Surface friction, belt flexibility and tracking requirements should be evaluated together.

Protect the part and the belt

Review contact pressure, metal edges and the condition of the conveyed surface. Use suitable belt support and transfer arrangements to reduce snagging and uncontrolled sliding.

Selection checklist

Provide the conveyor dimensions, pulley diameters, load distribution, start-stop cycle and exposure to oils or coolants. Performance depends on the specific belt construction and installation.
