Feltnova Movement Systems

Conveyor Belts for Primary Tobacco Processing

Slicing and conditioning

Confirm loading impact, product temperature and moisture. Note any steam exposure at conditioning drums and any washdown requirements.

Casing, flavoring and cutting

Check belt compatibility with additives and cleaning agents. Pay particular attention to carryback and buildup at discharge points.

Drying, expansion and machine feeding

Record the material temperature at each transfer, along with the throughput and expected distribution across the belt. Check the required tracking and feed consistency at the downstream machine.

Selection checklist

Provide belt width and length, pulley diameters, conveyor slope, operating temperature, belt speed and the cleaning cycle. Request current product and conformity documents for the exact construction under consideration.
