Feltnova

Insulation Production

Handling lightweight and compressible materials

Choose for the material

Mineral wool and other insulation products differ in density, surface condition and compressibility. The conveying surface should support the product without unnecessary deformation.

Review each process step

Forming, trimming, transfer and packaging may need different belt properties. Confirm whether heat, binder residues, dust or cleaning chemicals are present.

Control transfers

Check conveyor speed, gaps and support at transfer points. Suitable grip and coordinated movement help maintain product position during downstream handling.

Discuss your application with Feltnova

Supply material type, dimensions, loading and operating temperature. Validate the selected belt under the intended process conditions.
