# Belt Features and Selection Guide

## Profiles for inclines

Typical options include K profiles (10–17 mm), LB profiles (20–60 mm), T profiles (10 mm), loop profiles (20–100 mm) and rake profiles (up to 80 mm). Confirm available combinations with the belt construction.

## Sidewalls

Polyester sidewalls in heights from 40 to 80 mm can help contain loose material on inclines. Check clearance and carryback at the return pulleys.

## Edge sealing

Smartseal edge sealing covers exposed fabric at belt edges. Consider it where fraying or ingress of water, oil or grease is a maintenance concern.

## Energy demand

Amp Miser™ belting uses a low-friction underside to reduce drag on suitable slider beds. Compare drive power at the same speed and load when evaluating a retrofit.
